

CHALCONE COUMARINS

The present invention relates to a novel class of compounds which have structures related to certain naturally occurring and synthetic chalcones, as well as to methods for the preparation of such compounds and to pharmaceutical uses thereof.

The compound 1,3-diphenyl-2-propene-1-one is known by the trivial name chalcone. Many naturally occurring flavonoids share structural features with chalcone and are referred to by the generic term "chalcones". Also, certain flavonoids, including ones which are also classified as chalcones, have recently been demonstrated to have anticancer activity (Cancer Research 48, 5754, 1988) and chemopreventive activity in some tumours (J. Nat. Prod. 53, 23, 1990).

In particular, quercetin, an ubiquitous flavonoid found in plants, has been shown to act on the proliferation of human leukemic cells (Br. J. of Haematology, 75, 489, 1990) and on other cell lines (Br. J. Cancer 62 94, 942, 1990; Int. J. Cancer, 46, 112, 1990; Gynaecologic Oncology, 45, 13, 1992) and to possess a synergic action with common antiproliferative drugs.

In addition, some natural or synthetic chalcones, described in our International Patent Publication No. WO 9117749 and in International Patent Publication No. WO 96/19209 (Baylor College of Medicine) have proved to have a significant antiproliferative activity on a variety of different cell lines.

Although the mechanism of action of the antiproliferative activity of flavonoids and chalcones is still unknown, it is believed to be linked to the interaction of these compounds with type II estrogen receptors.

The action *in vivo* of these polyphenol substances is certainly much more complicated. All these compounds are generally characterised by an almost

complete insolubility in water and, *in vivo*, by a very poor bioavailability linked to a rapid metabolism of phenols and a marked affinity for lipids and proteins.

Surprisingly, it has now been found that certain novel chalcones, chalcone derivatives and chalcone analogues, in particular ones in which the phenyl ring in the 1-position is substituted or replaced by rings containing one or more heteroatoms, possess a greater antiproliferation activity both on sensitive cancerous cells and on cells which are resistant to common chemotherapeutic drugs, including the latest generation anti-neoplastic agents, paclitaxel and docetaxel.

Thus according to one aspect of the present invention, there are provided compounds of the general Formula (I):

In a preferred class of compounds, Ar contains a basic nitrogen function, for example,

R¹⁰ and R¹¹ preferably represent a saturated or unsaturated C₁₋₆ straight chain or branched hydrocarbyl group, in particular methyl, ethyl, n-propyl or isopropyl.

Of this preferred class, Ar is preferably substituted with one or more OR¹⁰ groups,

wherein R^{10} represents a saturated or unsaturated lower C_{1-6} straight or branched hydrocarbyl group. An especially preferred R^{10} group is methyl. Particularly preferred Ar groups include phenyl or phenyl substituted with 1, 2 or 3 methoxy groups.

For the preferred class of compounds wherein Ar comprises at least one basic nitrogen function, and wherein Ar represents a carbocyclic ring, the basic nitrogen function is provided by virtue of the carbocyclic ring comprising at least one substituent selected from $NHCOCH_3$ or $N(R^6)(R^8)$, wherein R^6 and R^8 are as defined as for Formula (I).

For the compounds of Formula (I), R preferably represents an unsaturated lower C_{1-6} straight or branched hydrocarbyl group. BIOLOGICAL EVALUATION

Compounds VIB 106 and VIB 122 were tested for their cytotoxicity against drug-resistant cancer cells, both alone, and in combination with paclitaxel. The results of these studies are shown below.

When tested alone, compounds VIB 106 and VIB 122 were found to possess relatively low cytotoxicity ($IC_{50} > 1 \mu M$) against drug-resistant cancer cells.

The compounds were then evaluated in combination with paclitaxel for their cytostatic activity against the drug-resistant breast cancer cells MDA-435/LCC6-MDR. In the experiments, the compounds were used in combination with paclitaxel, the paclitaxel being at a concentration of $0.1 \mu M$, the IC_{50} of paclitaxel decreases by 3-5 fold when used in combination with each of compounds VIB 106 and VIB 122, i.e. from 426 nM to 130-86 nM compared with paclitaxel alone. Consequently, in the presence of these compounds, paclitaxel can recover its excellent inhibitory activities against the drug-resistant cancer cells.

Compound	IC_{50} /nM	% Reduction in IC_{50} of paclitaxel
Paclitaxel	426	-
VIB 106 + Paclitaxel	86	80
VIB 122 + Paclitaxel	130	70

Experimental

The treatment consisted of concurrent exposure of MDA-435/LCC-MDR cells to paclitaxel in the presence or absence of the compounds reversing agent ($1 \mu M$) for 72 h *in vitro*. Assessment of cytotoxicity, i.e. cell growth inhibition, was determined according to the methods of Skehan, et al. as discussed in J. Nat. Cancer Inst., 82, 1107, 1990.

Briefly, cells were plated between 400 and 1200 cells/well in 96 well plates and incubated at 37°C for 15-18 h prior to drug addition to allow attachment of cells. Compounds were solubilized in 100% DMSO and further diluted in RPMI-1640 containing 10 mM HEPES. After a 72 h incubation, 100 µl of ice-cold 50% TCA was added to each well and incubated for 1 h at 4°C. Plates were then washed 5 times with tap water to remove TCA, low-molecular weight metabolites and serum proteins. Sulforhodamine B (SRB) (0.4%, 50 µl) was added to each well. Following a five minute incubation at room temperature, plates were rinsed 5 times with 0.1% acetic acid and air dried. Bound dye was solubilized with 10 mM Tris Base (pH 10.5) for 5 min on a gyratory shaker. Optical density was measured at 570 nm.
